

AQUA SOLUTION

Aqua Solution helps in self efficiency. It is essentially a device that uses a modified version of drip irrigation which minimalizes the loss of water and optimizes the growth of a plant. Topic is made using Artificial Intelligence by the help of Arduino which is an open-source electronics platform based on hardware and software.

It was made using an Arduino which helps sense whether the soil is wet or not; If the soil has less moisture, it will tell the water pump to supply water to it and if the soil already has moisture in it, then the water pump will stop.

It is a very easy to use device and it also saves you a bunch of time watering the plants.
